

TECHNOLOGY CONSULTING & DIGITAL SOLUTIONS

Transforming Businesses Through Technology.

We help organisations understand, design, build, integrate and improve the technology that runs their operations — starting with the business problem, not the software.

01 COMPANY OVERVIEW

A technology partner that starts with the business problem.

Auris Nexus Technologies (Pty) Ltd is a South African technology consulting and digital solutions company based in Sandton, Gauteng.

We help organisations understand, design, build, integrate and improve the technology they depend on, so that systems, processes and information work together in support of clear business objectives.

Our work sits where business operations and technology meet. We work with leadership and operational teams to understand how work is actually done, identify where technology can remove friction or create new capability, and then engineer and implement the solution — whether that is custom software, workflow automation, systems integration, data and reporting, or a practical application of artificial intelligence.

We do not begin with a product to sell or a technology to promote. We begin with the organisation's objectives, processes, people and constraints, and then select the approach that fits. Where an existing platform is the right answer, we say so. Where a custom solution is justified, we build it with sound architecture, security and long-term maintainability in mind.

ADVISE

Technology consulting

Assessing needs and options, defining requirements and shaping technology and transformation roadmaps.

ENGINEER

Solution delivery

Designing and building custom software, automation, integrations, data solutions and AI capability.

IMPLEMENT & IMPROVE

Adoption and support

Deploying into the operational environment, supporting users and improving the solution over time.

02 BUSINESS CHALLENGES WE ADDRESS

Most technology requirements begin as operational problems.

These are the challenges organisations typically bring to Auris Nexus, and how we respond to them.

01 Manual and spreadsheet-driven processes

Staff re-capture information, chase approvals by email and reconcile spreadsheets by hand.

RESPONSE Structured digital workflows with defined roles, approvals and audit trails.

02 Fragmented, disconnected systems

Core applications do not share information, so teams work around the gaps.

RESPONSE Systems integration, APIs and controlled data exchange between applications.

03 Poor information visibility

Management waits for month-end reports and cannot see operational status when it matters.

RESPONSE Dashboards, KPI reporting and automated reports drawn from operational data.

04 Workflow bottlenecks

Requests stall between people, teams and departments, with no clear ownership or status.

RESPONSE Workflow redesign with routing, notifications, reminders and escalations.

05 Outdated or ill-fitting technology

Legacy tools no longer reflect how the organisation operates and are difficult to extend.

RESPONSE Modernisation roadmaps, phased re-platforming and custom replacement where justified.

06 Inefficient data processes

Data is duplicated, inconsistent or difficult to trust, and reporting depends on manual effort.

RESPONSE Sound data models, validation, migration and a single source of truth.

07 Unclear technology direction

Investment decisions are made before requirements, options and risks are properly understood.

RESPONSE Technology assessments, solution options analysis and implementation roadmaps.

08 AI interest without a defined use case

There is pressure to adopt AI, but no agreed use case, data position or governance approach.

RESPONSE Use-case identification, controlled pilots and integration into existing workflows.

03 CORE SOLUTIONS

Five core solution areas.

Each solution area starts with a defined business problem and ends with technology that is in use.

SOLUTION 01

Technology Consulting

Practical, independent guidance on how technology should support the organisation's objectives.

THE CHALLENGE

Organisations are often asked to commit to systems, vendors or budgets before the underlying requirement, the available options and the risks are clearly understood.

WHAT WE DELIVER

- Technology and process assessments
- Requirements definition and business analysis
- Solution options and build-versus-buy evaluation
- Solution architecture guidance
- Technology roadmaps and implementation plans

SOLUTION 02

Custom Software Development

Software designed and engineered around specific operational and business requirements.

THE CHALLENGE

Off-the-shelf products can force an organisation to adapt its processes to the software, while spreadsheets, email and paper cannot scale with the business.

WHAT WE DELIVER

- Business applications and internal platforms
- Client, staff and stakeholder portals
- Multi-tenant and role-based systems
- Secure web applications with authentication
- Management and operational dashboards

SOLUTION 03

Business Automation

Replacing repetitive manual work with structured digital workflows and automated processes.

THE CHALLENGE

Approvals, notifications, data capture and reporting consume staff time and introduce delay and error. We automate where it creates real value and keep people in control where judgement is required.

WHAT WE DELIVER

- Approval and workflow routing
- Notifications, reminders and escalations
- Data validation and system-to-system transfer
- Document processing
- Scheduled and automated reporting

03 CORE SOLUTIONS — CONTINUED

SOLUTION 04

Digital Transformation

Modernising processes, systems, data and technology capability in a structured, phased way.

THE CHALLENGE

Transformation initiatives stall when they are treated as a single large technology purchase rather than a sequence of well-defined, measurable business changes.

WHAT WE DELIVER

- Current-state process and systems review
- Target-state design and phased roadmap
- Process digitisation and system modernisation
- Data migration and consolidation
- Adoption support and user training

SOLUTION 05

AI Integration

Identifying and implementing practical applications of AI within existing workflows and systems.

THE CHALLENGE

AI initiatives often begin with the technology rather than a defined use case, the available data and a clear position on privacy, oversight and risk.

WHAT WE DELIVER

- Use-case identification and prioritisation
- Knowledge assistants over organisational information
- Document classification, extraction and summarisation
- Intelligent routing and decision-support features
- Controlled pilots with human oversight

Supporting capabilities

Applied within engagements, or delivered on their own where required

Business Systems

HR, leave, CRM, operations and administration platforms built around defined roles, records and approvals.

Data & Business Intelligence

Data models, dashboards, KPI reporting and management information for timely decisions.

Systems Integration

APIs and integrations that connect business applications, websites and data sources.

Web Development

Corporate websites and web applications with sound information architecture, performance and search foundations.

Mobile Applications

Mobile solutions for field teams, service requests, inspections and data capture.

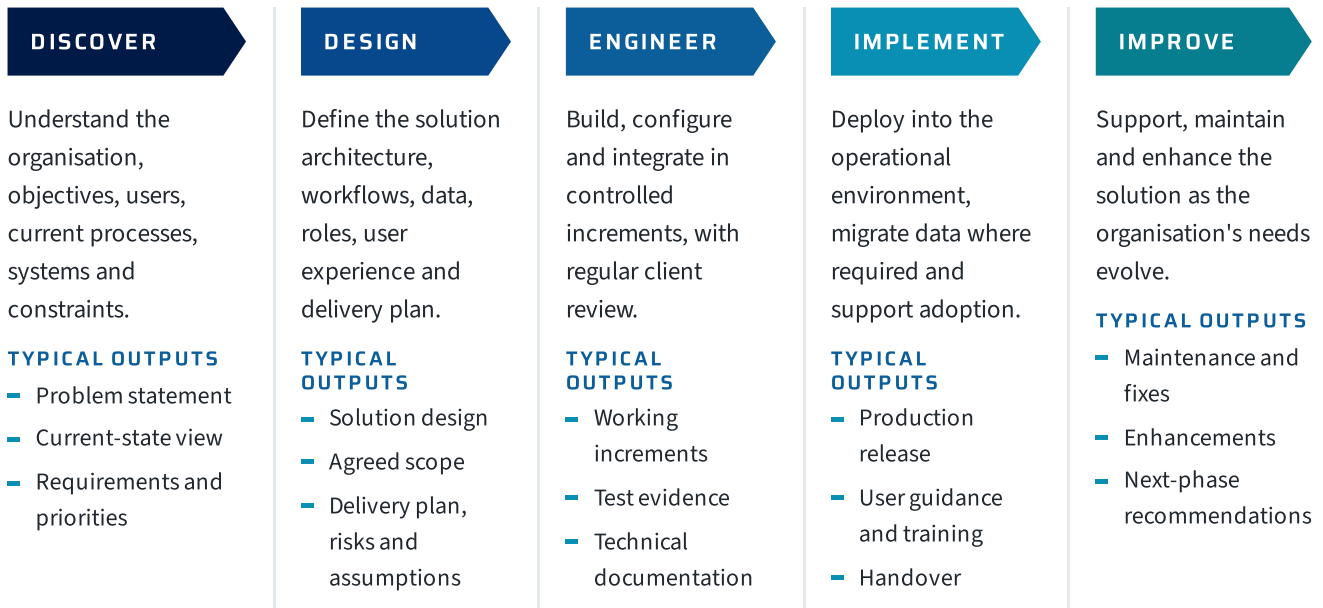

Technology Support

Maintenance, issue resolution and enhancement of delivered solutions under agreed support terms.

— 04 OUR APPROACH

A structured path from business problem to working solution.

Every engagement follows the same disciplined sequence, scaled to the size and risk of the work.

How we manage delivery

Clear scope and change control

Scope, priorities and assumptions are agreed up front; changes are assessed and approved before they are built.

Visible progress

Regular reviews and demonstrations show what is complete, what remains and what happens next.

Quality built in

Functionality, permissions, workflows and responsiveness are tested before each release.

Security and privacy by design

Access control, data protection and POPIA considerations are addressed from the design stage.

Documentation and handover

Solutions are documented so that they can be operated, supported and extended.

Business outcome focus

Success is judged by whether the organisation works better, not by the number of features delivered.

05 TECHNOLOGY & DELIVERY CAPABILITY

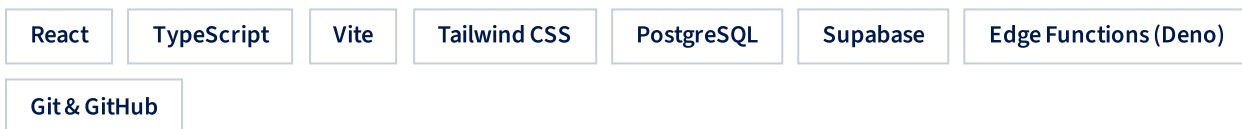

Modern engineering, applied with discipline.

Technology is selected for the problem. We do not add complexity to make a solution sound sophisticated.

ENGINEERING CAPABILITIES

- Solution and data architecture
- Multi-tenant platform design
- Authentication and role-based access
- Relational database design
- API development and integration
- Workflow automation
- Dashboards and reporting
- AI integration
- Responsive web and mobile interfaces
- Automated and end-to-end testing
- Version control and controlled release
- Performance optimisation

TECHNOLOGIES IN CURRENT USE ACROSS AURIS-BUILT PLATFORMS

Where a client has established platforms, standards or architecture guidelines, solutions are designed to fit within them.

Security, privacy and responsible engineering

Security is part of the solution, not a feature added at the end. Depending on the engagement, this includes authentication, role-based access control, tenant-level data separation, database-level access policies, auditability, secure deployment practices and backup and recovery planning.

Solutions that process personal information are designed with the Protection of Personal Information Act (POPIA) in mind.

Responsible use of AI

AI is applied to defined use cases with a clear purpose, appropriate data, human oversight of consequential decisions and evaluation before wider rollout.

Organisational and personal information is handled according to the client's privacy and security requirements.

Auris Nexus does not currently hold ISO or other formal certifications and does not represent itself as a certified security provider. Security controls applied in a solution can be documented for due-diligence review.

06 SELECTED EXPERIENCE

Platforms and solutions engineered by Auris Nexus.

Each item carries an evidence status, so that delivered client work is clearly distinguished from Auris-owned platforms under ongoing development.

Funda360

Education · School management platform

■ **AURIS-OWNED PLATFORM · IN DEVELOPMENT**

A multi-tenant platform that brings school administration into one structured environment: learner and guardian portals, academics, attendance, homework, finance, staff and leave administration, and reporting.

Demonstrates: multi-tenant architecture, authentication, role-based access, PostgreSQL data design with row-level security, and automated and end-to-end testing.

LOGIOS OS

Logistics & transport · Operations platform

■ **AURIS-OWNED PLATFORM · IN DEVELOPMENT**

A modular, multi-tenant operations platform designed around scheduling, jobs, incidents, fleet, drivers, customers, compliance and operational reporting.

Demonstrates: bringing multiple operational domains into one system with structured data models and role-aware workflows.

Sebetsa

Facilities & operational services · Workforce platform

■ **AURIS-OWNED PLATFORM · IN DEVELOPMENT**

A platform for distributed workforce and site operations, covering workforce records, attendance, leave, site operations, tasks, multi-site workflows and reporting.

Demonstrates: reuse of proven software foundations for field-based and multi-site operational environments.

CIT Employee & Leave Management

Corporate services · HR and workforce administration

■ **BUSINESS SYSTEM DEVELOPMENT**

A purpose-built internal business system covering employee records, leave administration, approval workflows, role-based access and HR reporting.

Demonstrates: the application of custom business software to internal organisational processes.

Pro Energy Solutions

Energy · Corporate website

■ **DELIVERED CLIENT WORK**

Design and development of a responsive corporate website with attention to information architecture, mobile experience, technical search foundations, performance and clear enquiry paths.

Demonstrates: client-facing web delivery from structure and design through to launch.

Client names, logos, testimonials and measured outcomes are published only where authorised and evidenced. Further detail on these platforms can be provided on request.

07 WHO WE WORK WITH

WHERE WE HAVE BUILT

Education	School management (Funda360)
Logistics & transport	Operations platform (LOGIOS OS)
Facilities & operations	Workforce platform (Sebetsa)
Corporate services	HR and leave system (CIT)
Energy	Corporate website (Pro Energy)

ORGANISATIONS WE ARE STRUCTURED TO SUPPORT

- Corporate and enterprise organisations with operational, integration or reporting challenges
- Operations-heavy organisations with distributed teams, field work or complex workflows
- Organisations undertaking digital transformation or AI adoption initiatives
- Small and medium enterprises moving from manual to structured digital operations
- Education and institutional environments

08 WHY ORGANISATIONS ENGAGE AURIS NEXUS

Business understanding and engineering capability, in one partner.

01 Business-first thinking

We define the problem, the process and the intended outcome before recommending technology.

02 Consulting and engineering together

The same partner that assesses the requirement designs and builds the solution, reducing loss between advice and delivery.

03 Fit-for-purpose solutions

Custom development where it is justified; existing platforms where they are the better answer.

04 Integration and automation focus

We address the gaps between systems, teams and processes — not only individual applications.

05 Practical, governed AI

AI applied to defined use cases, with human oversight and privacy safeguards.

06 End-to-end accountability

From discovery to implementation and improvement, with transparent scope, progress and change control.

07 Evidence-led representation

We keep what we have delivered, what we have built and what we can deliver clearly distinct.

08 Locally based

A South African company, headquartered in Sandton, Gauteng.

09 CORPORATE CREDENTIALS

Corporate information for procurement and supplier onboarding.

COMPANY DETAILS

Registered name	Auris Nexus Technologies (Pty) Ltd
Company registration (CIPC)	2026/606690/07
Head office	140 Linden Road, Sandown, Sandton, Gauteng, South Africa
B-BBEE status	Level 1
Ownership	100% South African-owned
Supplier registration	Registered on the National Treasury Central Supplier Database (CSD)
Managing Director	Loyiso Ngcala
Certifications and memberships	None currently claimed

Governance

Auris Nexus has prepared a Version 1.0 governance policy pack covering:

- POPIA and privacy
- Information security
- Complaints and compliments
- Health and safety
- Procurement and supplier conduct
- Anti-bribery and corruption
- Business continuity
- Code of conduct and ethics
- Data retention and records
- Conflict of interest

Supporting documents on request

- CIPC registration documents
- B-BBEE verification document
- CSD registration report
- Governance policies

Banking details are provided only on company letterhead through a verified channel, never in circulated documents. Please verify any request to change banking details directly with Auris Nexus.

10 ENGAGE AURIS NEXUS

Discuss your technology requirements.

You do not need a finished specification to begin. Most engagements start with a conversation about a problem: a process that is too manual, systems that do not connect, information that is hard to see, or a transformation or AI initiative that needs structure.

WAYS TO ENGAGE

Discovery & advisory

A focused assessment that defines the problem, the options and a recommended approach.

Solution delivery

Design, engineering and implementation of a defined solution.

Pilot or proof of concept

A scoped first phase that validates the approach before wider rollout.

Support & enhancement

Maintenance and continued development of delivered solutions.

Delivery partnership

Working alongside internal IT teams, consultants or implementation partners.

Modernisation

Improving or replacing existing systems and processes that no longer fit.

WHAT HAPPENS NEXT

01 Conversation

An initial discussion of objectives and challenges.

02 Discovery

Clarifying requirements, constraints and priorities.

03 Proposal

Scope, approach, timeline and commercial terms.

04 Delivery

Structured delivery, implementation and support.

Request a technology consultation.

Contact Auris Nexus Technologies to discuss your requirements or to request a proposal.
